
Lab 7 - Sockets

Write a client-server code such that:

1. When the client connects to the server, the client sends a "hello" message
2. The server reads the message and replies with a "Hello back".
3. The client reads the message from the server then reads an array of integers from the users and send it to the server
4. The server should print the array of integers, compute their sum and return it to the client
5. The client should read the result and print it.

Sample Server/Client:

```
(kali㉿kali) - [~/Desktop]
$ ./Server
Received: hello

Waiting for client to send array
Number of bytes read = 12; thus 3 is the size of the array
10 20 30
finished reading
computing sum
Sum : 60
█
```

```
(kali㉿kali) - [~/Desktop]
$ ./Client

received: hello client
please enter the size of the array:
3
Please enter 3 numbers:
10
20
30
sum 60

(kali㉿kali) - [~/Desktop]
$ █
```
