
Lab 7 - Multithreading

Question 1

Write a program that creates a single thread that will print Hello world.

Question 2

Write a program that creates 3 threads that will print "Hello from thread [id]"

Question 3

Write a program that will create 4 threads to calculate partial sums of an int array of 20 integers, then the total sum should be calculated from all the partial sums. So, each thread will calculate the sum of 5 elements from the array, then all the partial sums returned will be accumulated to get the total sum of all 20 array elements.

Question 4

Write a program that creates an array of integers of size 100. Create 4 threads and assign each thread a subarray of equal size. Each thread should fill its subarray with integers. Let each array print its segment of filling, and the sum of each segment. After the threads end their work, print the full array.
